Inflammation

Inflammation

Inflammatory reactions are generated in response to external and internal stimuli, such as infection, trauma, clinical insult or dysregulation of the immune system. The inflammatory responses may be antigen-specific or non-specific, local or systemic, chronic or rapid and severe, characterized by a massive release of mediators, often lethal. The aim of this book is to review selected aspects associated with the mechanism of the pathology of inflammatory processes of different origin and to evaluate therapeutic strategies aimed at combating various inflammatory diseases. The introductory article describes the immunological status of patients with severe sepsis, with particular attention paid to the role of circulating neutrophils. Integrin activation and chemokine receptor expression and the roles of IL-15, prostaglandins and leukotrienes in inflammation and immunity are the subjects of next articles. Subsequent reviews are focused on allergic diseases involving mast cells and Th2 type cytokines, in particular the mechanisms of atopic dermatitis and signaling by IL-13. The inflammatory responses elicited by *Mycobacterium tuberculosis* and *Mycobacterium avium* are also analyzed with special interest paid to the mechanisms which allow the bacteria to escape the host's immune reactions. The therapeutic potential of IL-10 in infection and inflammation and the possible factors contributing to the development of idiopathic pulmonary fibrosis are reviewed in the next articles. The final report demonstrates the advantages of bacteriophage therapy in the context of the aggravating problem of bacterial resistance to antibiotics.
