Ion Channel Reconstitution

Ion Channel Reconstitution

It is now over 30 years since the idea of ion-conducting pores burst on the electrophysiological scene, 15 years since these were generally realized to be membrane-spanning proteins, and 10 years since the first observations of single ion channels from higher organisms were made. During the past 5 years, several integral membrane channel proteins have been purified in a functionally competent state: the nicotinic acetylcholine receptor, the Na⁺ channel, mitochondrial "VDAC," and a variety of porins. The stage is thus set to attack ion channels in the same ways that biochemists have been attacking enzymes for decades: isolation followed by functional analysis in as simple a system as possible, with a view towards understanding the molecular mechanisms of the protein's behavior and how this is related to the underlying molecular structure. This is always a daunting task, all the more so with ion channels because of our still primitive and scanty understanding of channel structures and because of the difficulty in isolating functionally active channel proteins. In this volume, which can be considered a biochemically slanted companion to Sakmann and Neher's *Single-Channel Recording*, I have tried to present a view of the current landscape of ion-channel reconstitution. These chapters illustrate not only the different approaches and techniques of the major practitioners of ion channel reconstitution but, as importantly, the varied motivations for doing this kind of work.
