## **Trigonometry** Roy Dubisch

This text has as its main feature a treatment of trigonometric functions as functions of real numbers, with trigonometric functions of angles as a subordinate topic. In this way trigonometry is brought into closer contact with preceding courses in algebra and future courses in calculus. Thus, on the one hand, trigonometry is made more useful for future work in mathematics and, on the other hand, is made more intelligible by being more closely connected with past work. Because of the importance of the function concept, both here and in other parts of mathematics, the introductory chapter is devoted largely to a discussion of functions. The definition used is that of a rule of correspondence between two sets of objects and a distinct is carefully maintained throughout between a function and a function value. Chapter 2 discusses the common properties of the sine and cosine functions by the use of "arc length functions". This chapter also contains instructions for the use of the "arc length protractor" included with this book. The remainder of the text follows the general pattern of many trigonometry texts "except" that up to Chapter 8 the real number point of view is maintained. Then, in Chapter 8, a transition is made to functions of angles and in later chapters triangle solution, including work with logarithms, is presented.
